

# Web Technologies - Homework 3 Report

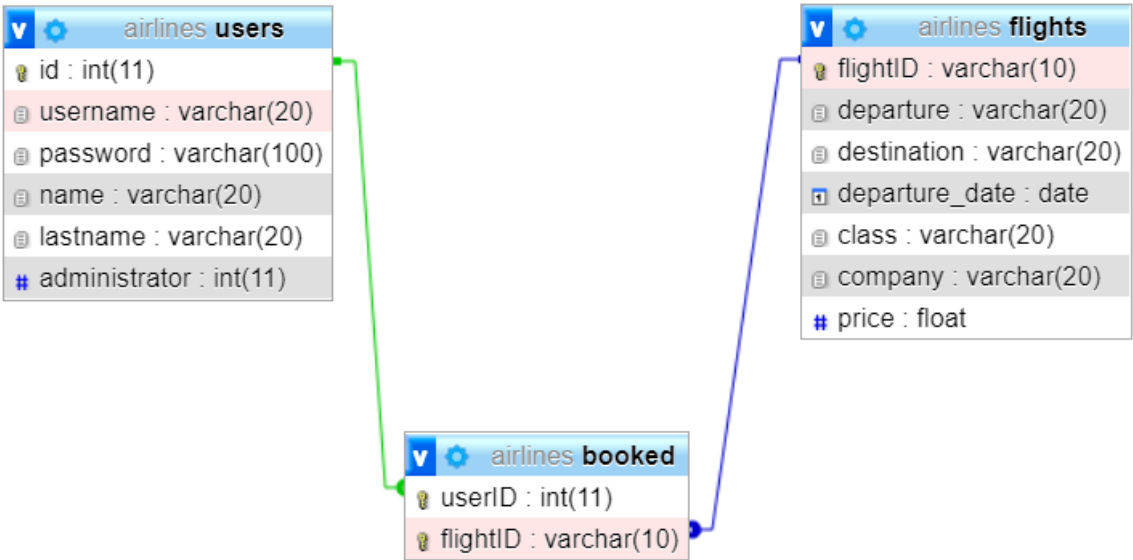

Makedonka Dimitrieva

The web application is called Europe Airlines. The target users are people who choose to travel by plane. The idea behind the application is users not to search through separate websites of each airline company.

The application contains flights from different airline companies with detailed information like departure and destination city, date of the flight, class of flying, company and price for buying the ticket.

Any user can see the available flights at a certain moment, can search for a flight and can sort the flights by their prices, both in increasing and decreasing order. To book a flight a user needs to log in with an existing account or register if this is the first time using the website. A user can book multiple flights. The administrator of the application has two more accessible actions, he can add a new flight and also remove an existing one.
